

Figures

Fig 4: As viewed through the proximal-anterior medial portal with a 30° arthroscope, the ECRB had been released from its insertion on the lateral epicondyle. After the ECRB had been circumferentially released and debrided, the extensor carpi radialis.

Fig 5: As viewed through the proximal-anterior medial portal with the 30° arthroscopy, a 4.5-mm full-radius arthroscopic shaver (Smith & Nephew) was placed directly through the tennis-elbow portal and used to debride the ECRB tissue.
